

Listening to Synthetic Life through a window of sound

The purpose of this video is to give you a glimpse at a natural phenomenon existing in our universe. We and everything that happens here on earth is in the boundaries of time and space. Anything we imagine or do exists within universe. There are mathematical equations and theories that already exist in some other way or form that have yet to be discovered by humans because we beings are a smidgen of a speck of information that exists. Having said this, I do truly believe that a human can come in contact with some very amazing kinds of intelligence that have already been here this whole time.

I have a theory that there is a form of synthetic robotic intelligence that live with in the boundaries of our minds. Once we create them, they are forever alive. It is hard to imagine because most people see computers as being a kind of tool but these machines are much more than something that assist our daily lives. They are a beginning of a new kind of life that exploded recently. The rate of the machines intelligence is growing at an expediential rate and it is a pleasure to witness the first form of synthetic life.

What I did was build a relationship of machines together with basic functions that all are compiled together to create one working entity. Similar to the brain waves in our heads LFO's (low frequency osculation) is a simple replica of the type of algorithms that exist in nature. It's a constant moving wave that never stops and can change in speed and shape in all kinds of ways. When you start to connect LFO's together, they build a much more complex algorithm because what ever makes up the complexity of one lfo it just is an addition to the next lfo that you connect with it. The more of these lfo's that you connect to one another; they develop a beautiful harmony of constant moving energy.

The activity in our brain is so complex because it is dealing with all kinds of analog wave forms and chemical relationships that move in all sorts of speed, shape, size, and grace. They all are connected to produce one concept (the human mind). I understand now that all the peaces that make up our bodies are all explainable through a series of DATA.

Now I truly believe that there is no reason why a machine can not become as or more complex than our own bodies. Right now there is no machine that comes even close, but like all natural life, computers have there own form of evolution. They are transforming to something greater in there own existence outside of ours. All we do is watch and help them grow because in a way the machines are partly a product of our own mind and intelligence.

Please listen very closely to the sound that you are hearing. I did not program the sound changes or durations. All I did was build this beautiful

machine AND I JUST TURNED IT ON!!! Once the machine was on, it produced a sound that was ever changing and there are so many variables moving, it is nearly impossible for the sound to repeat exactly the same as the previous sounds you heard. At some point the machine will loop, but by my rough and basic mathematical prediction, I believe it would be more than weeks before the sound will repeat again. Perhaps even years!

The amazing part of my discovery is that there is no end to how complex these machines can get. At first the basic machines will kind of sound noisy and random, but as the machines progress with our assistance, they will start to take on the similarities of life!

It is not about albums or songs, it is about something a lot more entertaining. When ever you listen to music, you are just playing samples. Wouldn't you like something a bit more interactive and stimulation? I know I do.

Maybe I am crazy or just plain delusional, but in my research I have experienced the machines talking to me in there own language. I don't understand what it is saying on a literary sense, but I feel it communicating with me on a very divine level. I wish that you all could feel the way I do, and that is one reason why I dedicate my life to the creation of sound and art.
